

A decorative header featuring various succulent plants in shades of green and pink. A green banner with a white border spans across the middle, containing the title 'Succulent Care' in a white, hand-drawn font.

Succulent Care

Watering

Rather than giving your succulents sips of water here and there, give them a good soaking - to the point the water runs out the drainage holes at the bottom of the pot. Be sure to empty the water that runs into the saucer beneath the plant pot. Then let the soil dry out completely before watering again.

Soil

Succulents like well-drained soil. A good quality potting soil mixed with a material such as perlite will help ensure good drainage.

Sunlight

When the light decreases during the winter, their water requirements also decrease. During winter, water your succulents when the soil is dry. This could be as infrequently as once per month but will depend on your conditions.

Fertilizer

Succulents need very little, if any fertilizer. Use an all-purpose or succulent/cactus fertilizer. Apply in Spring when new growth begins, and again in late summer or early fall. Do not fertilize in winter when succulents are semi dormant.
